

LLM Prompt for Open-Ended Response Analysis

Prompt used for qualitative codebook development

Prompt: Analyze the open-ended survey responses from final-year undergraduate computer science students about confidence, classroom participation, hesitation in asking questions, academic communication, perceived effects of the university gender environment, and readiness for future mixed-gender professional workplaces. Treat each participant's open-ended answers as one response set and identify descriptive, non-mutually exclusive themes that are clearly supported by the data. Use the original meaning of the responses, avoid adding interpretations not present in the text, and do not infer participants' identities, abilities, intentions, or causes beyond what they explicitly state. Suggest concise theme names, operational definitions, inclusion and exclusion criteria, and representative paraphrased examples for each theme. Themes should help compare female students in coeducational universities with female students in the women-only university, especially around classroom comfort, fear of judgment, silence or hesitation, communication with male peers, gradual adaptation, workplace preparation, future mixed-workplace anxiety, limited social learning, academic focus, and gender bias. The output should be used only as assistance for developing and refining a human-reviewed codebook; final theme selection, merging, removal, definition refinement, and coding decisions must remain the responsibility of the researcher.
